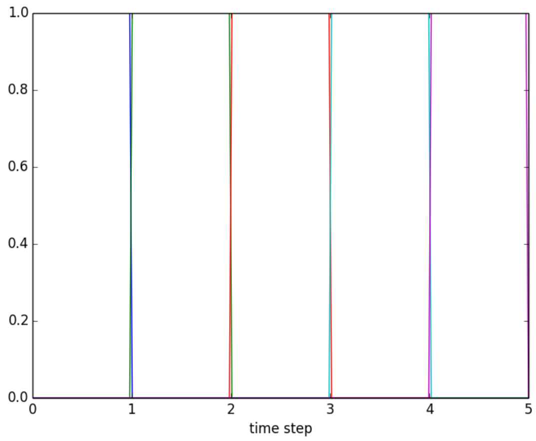
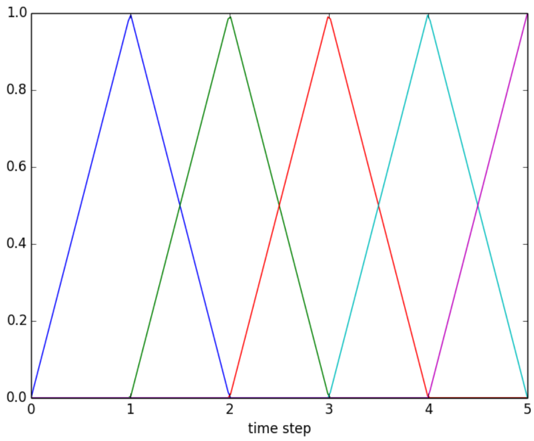
Robotics Assignment #05

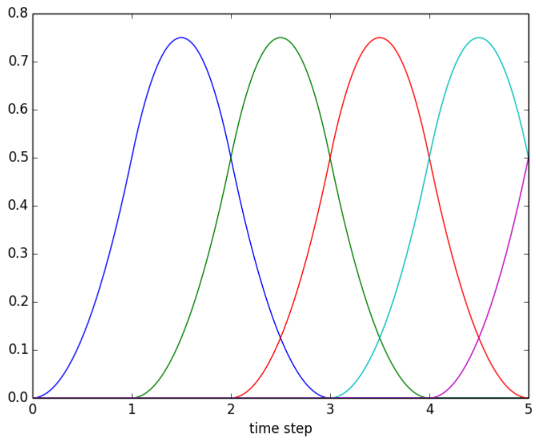
Paul Bienkowski, Konstantin Kobs

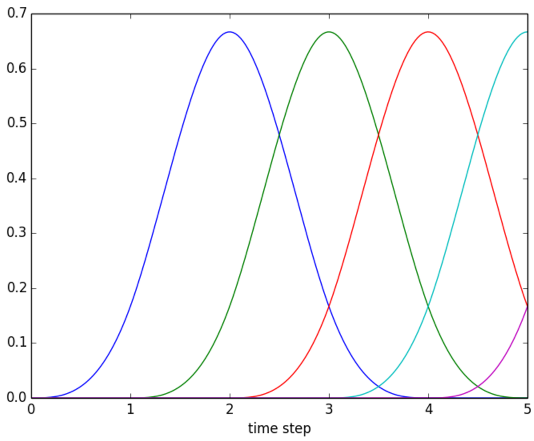
21. Juni 2015

Task 5.1. We wrote a script in Python to calculate the basis splines. These are the plots we got from our code:









The code is the following and can be found in 5.1.py:

```
from matplotlib import pyplot as plt
import numpy as np

# time series
t = [0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]

def N(i, k, time):
    """This function calculates the normalized basis spline as shown
       on slide 220"""
```

```
    if k == 1 and time >= i and time < i+1:
        return 1
    elif k == 1:
        return 0
    elif k > 1:
        return (time  t[i])/(t[i + k  1]  t[i]) * N(i, k 1, time)
          + (t[i+k]  time)/(t[i+k]  t[i+1]) * N(i+1, k 1, time)

# With this the function can be applied to numpy arrays element wise
func = np.vectorize(N)

# Create an array with 200 evenly spaced numbers between 0 and 5
x = np.linspace(0.0, 5.0, num=200)

# Use every k with k in [1, 2, 3, 4]
for k in range(1, 5):
    # Use every i with i in [0, 1, 2, 3, 4]
    for i in range(0, 5):
        # Calculate all the numbers
        y = func(i, k, x)
        # Plot the function
        plt.plot(x, y)
        # Set the x axis label
        plt.xlabel("time step")
        # Save the plot as png
        plt.savefig('5 1 k=' + str(k) + '.png')
    # Clear the figure
    plt.clf()
```

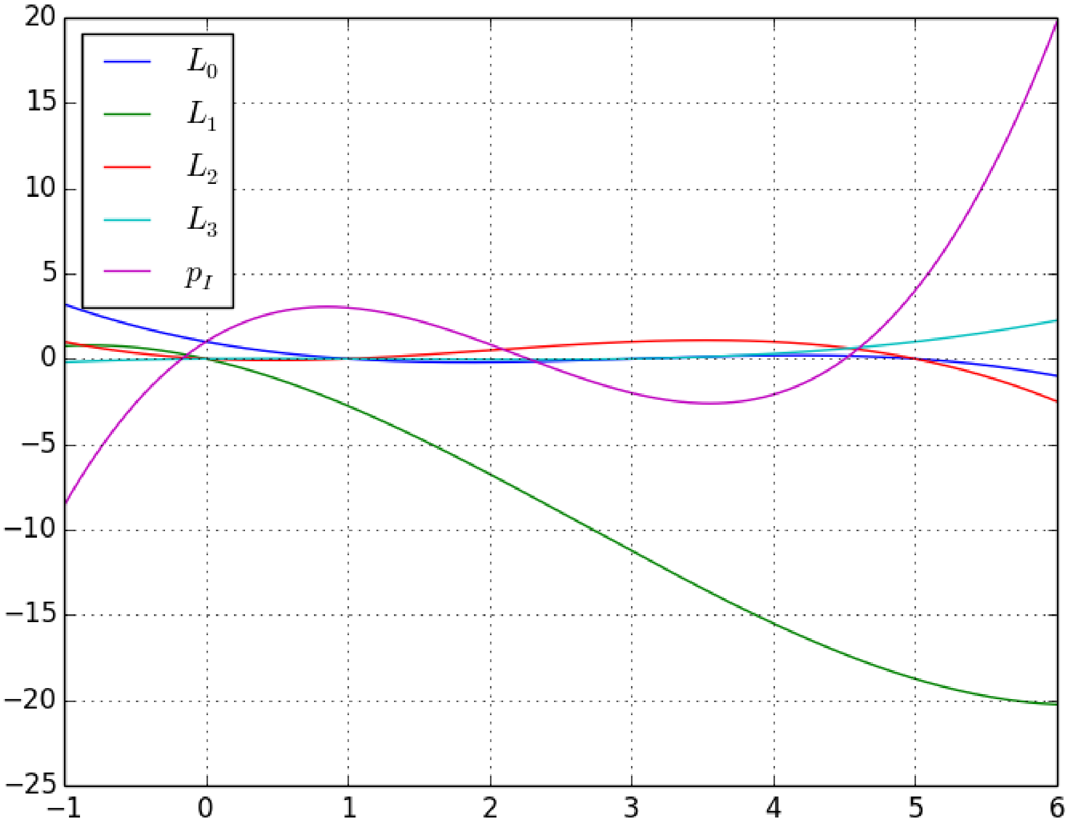
Task 5.2.

Task 5.3.

$$
\begin{aligned}
L_0(x) &= \frac{(x-1)(x-3)(x-5)}{(0-1)(0-3)(0-5)} \\
&= \frac{(x^2-4x+3)(x-5)}{-15} \\
&= \frac{x^3-9x^2+23x-15}{-15} \\
&= -\frac{1}{15}x^3 + \frac{9}{15}x^2 - \frac{23}{15}x + 1 \\
L_1(x) &= \frac{(x-0)(x-3)(x-5)}{(1-0)(1-3)(1-5)} \\
&= \frac{x^3-8x^2+15x}{8} \\
&= \frac{1}{8}x^3 - x^2 + \frac{15}{8}x \\
L_2(x) &= \frac{(x-0)(x-1)(x-5)}{(3-0)(3-1)(3-5)}
\end{aligned}
$$

$$
\begin{aligned}
&= \frac{x^3 - 6x^2 + 5x}{-12} \\
&= -\frac{1}{12}x^3 + \frac{1}{2}x^2 - \frac{5}{12}x \\
L_3(x) &= \frac{(x-0)(x-1)(x-3)}{(5-0)(5-1)(5-3)} \\
&= \frac{x^3 - 4x^2 + 3x}{40} \\
&= \frac{1}{40}x^3 - \frac{1}{10}x^2 + \frac{3}{40}x \\
p_I(x) &= y_0 L_0(x) + y_1 L_1(x) + y_2 L_2(x) + y_3 L_3(x) \\
&= 1 \cdot L_0(x) + 3 \cdot L_1(x) - 2 \cdot L_2(x) + 4 \cdot L_3(x) \\
&= \left(-\frac{1}{15}x^3 + \frac{9}{15}x^2 - \frac{23}{15}x + 1\right) + 3 \cdot \left(\frac{1}{8}x^3 - x^2 + \frac{15}{8}x\right) \\
&\quad - 2 \cdot \left(-\frac{1}{12}x^3 + \frac{1}{2}x^2 - \frac{5}{12}x\right) + 4 \cdot \left(\frac{1}{40}x^3 - \frac{1}{10}x^2 + \frac{3}{40}x\right) \\
&= -\frac{1}{15}x^3 + \frac{9}{15}x^2 - \frac{23}{15}x + 1 + \frac{3}{8}x^3 - 3x^2 + \frac{45}{8}x \\
&\quad + \frac{1}{6}x^3 - x^2 + \frac{5}{6}x + \frac{1}{10}x^3 - \frac{2}{5}x^2 + \frac{3}{10}x \\
&= \left(-\frac{1}{15} + \frac{3}{8} + \frac{1}{6} + \frac{1}{10}\right)x^3 + \left(\frac{9}{15} - 3 - 1 - \frac{2}{5}\right)x^2 + \left(-\frac{23}{15} + \frac{45}{8} + \frac{5}{6} + \frac{3}{10}\right)x + 1 \\
&= \frac{69}{120}x^3 - \frac{19}{5}x^2 + \frac{627}{120}x + 1 \\
&= \frac{23}{40}x^3 - \frac{19}{5}x^2 + \frac{209}{40}x + 1
\end{aligned}
$$

We then used Python to visualize the data. This is what we got:



Task 5.4.
